9. Exceptions and escalation rules

1. Purpose

This SOP describes how NutrYWell receives customer orders, consolidates them in an Excel Order Book, validates order information, registers orders in ERP, instructs the warehouse for preparation, coordinates transportation, and ensures customer communication and traceability up to shipment dispatch. The objective is to standardize execution across channels and reduce late confirmations and delivery delays.

2. Scope

This procedure covers the end-to-end order-to-ship flow for finished goods shipped from NutrYWell distribution centers, from initial order capture through dispatch to the carrier. It applies to all customer channels and all countries served by NutrYWell.

3. Order channels and order capture

NutrYWell serves four commercial channels. Each channel has a different front-end order capture method, but all channels converge to the same downstream execution flow: shared Outlook intake -> Excel Order Book (consolidation and completeness checks) -> ERP order entry (J+1 target) -> Warehouse preparation -> Logistics control -> Carrier dispatch -> customer updates and invoicing follow-up.

3.1 Channel definitions

E-commerce: the customer places an order via an online form (not connected to ERP). Form submissions are routed directly to the Logistics shared mailbox for intake and processing.

Pharma, Retail Classic, Retail Sport: customers place orders through their Sales contact (phone/email). Sales consolidates the customer request and forwards the order by email to the Logistics shared mailbox.

3.2 Minimum information required to process an order

An order can be entered in ERP only when the minimum required information is available. Every incoming order is first logged in the Excel Order Book; if any element is missing, Logistics initiates a clarification loop with Sales and/or the customer before ERP entry.

- Customer identification and billing entity (account reference).
- Ship-to address (or ship-to code) and delivery country.
- Customer PO reference (or equivalent customer reference).
- Requested delivery date (or requested ship date) and any delivery constraints.
- Product references (SKU), quantities, and unit of measure.
- Channel and any customer-specific instructions (documentation, labeling, etc.).

4. Roles and responsibilities

The flow relies on a clear separation of roles. Sales does not use ERP; order entry and execution coordination are performed by Logistics.

Role	Core responsibilities	Main outputs
Sales (Commercial)	Receives customer orders for Pharma, Retail Classic and Retail Sport channels. Forwards available order information and attachments to the Logistics shared mailbox; supports clarification requests and customer communication when needed.	Order email to Logistics; customer clarifications; channel context.
Customer Service & Logistics Specialists (CSLS)	Inbox triage (daily Order Intake Coordinator rotation), registration and follow-up in the Excel	ERP order entry; warehouse request / picking instruction; logistics confirmations; status

	Order Book, order validation, clarification loop, ERP order entry by J+1 target (when information is complete), generation of warehouse request (picking instruction), coordination with warehouse and carrier, document checks, customer status updates.	communications; Order Book updates.
CSLS Team Lead	Ensures workload balancing, adherence to standards (J+1, documentation in the Order Book), escalation management, cross-functional alignment (IT, planning, finance), continuous improvement and training.	Escalation decisions; prioritization; process governance.
Warehouse / DC Operations	Receives warehouse request, performs picking and packing, produces preparation documents, confirms actual picked quantities, stages shipment for pickup.	Packing list / preparation confirmation; shipment readiness confirmation.
Transportation Provider (Carrier)	Performs collection and transport; provides tracking	Pickup confirmation; tracking reference.

	information to Logistics (as applicable).	
Planning / Supply (where applicable)	Supports allocation decisions when supply constraints exist; validates feasibility of requested dates and priorities.	Allocation / feasibility inputs.
Finance / Invoicing (where applicable)	Ensures invoice and financial documents are issued based on confirmed shipment and supporting documents.	Invoice issuance; financial documentation.

5. Process principles and controls

5.1 J+1 intake standard

All orders received in the Logistics shared mailbox must be logged in the Excel Order Book on the day of receipt and entered into ERP no later than J+1, provided the minimum required information is available. When information is missing, the order remains pending in the Order Book and is tracked until completion.

5.2 Mailbox governance

A daily CSLS rotation assigns one specialist as the Order Intake Coordinator. The Order Intake Coordinator monitors the shared mailbox, registers all orders in the Excel Order Book, prioritizes urgent requests, and distributes ownership to CSLS processors. This ensures traceability and reduces the risk of missed orders.

5.3 Documentation of issues and exceptions

Because ERP does not capture qualitative intake issues (e.g., missing elements, customer clarifications, root cause notes), CSLS maintains an Excel Order Book as the single intake register and follow-up tool. Orders are documented case by case with the reason for any

blockage, actions taken, and resolution status, until ERP entry and dispatch coordination are secured.

5.4 No internal shipment consolidation

Each customer order is executed as an individual shipment request. NutrYWell does not consolidate multiple orders into a single internal shipment or pallet build for transportation optimization. A carrier may collect multiple shipments in the same route, but the execution and costing logic remain order-based.

5.5 Acquired portfolio - parallel system and migration

Some products from a recently acquired portfolio may temporarily remain managed in a parallel legacy system until full master data setup is completed. During this transition, extracts from the parallel system can support operational tracking. NutrYWell's target state is a single operating model: all products, including acquired items, processed through ERP with the same Outlook intake, Excel Order Book consolidation, and J+1 entry standard.

1 pallet =
1 customer

6. Process flow diagrams

The diagrams below provide visual support for (1) channel-specific order capture (front-end) and (2) the standardized execution flow (back-end).

Figure 1 – Channel-specific order capture (front-end)

Figure 2 – Standardized execution flow (back-end)

7. Detailed procedure (end-to-end)

7.1 Step 1 – Order capture and transmission to Logistics

Orders are received by Logistics through the shared mailbox. For e-commerce orders, the customer-submitted online form routes directly to the Logistics shared mailbox. For Pharma/Retail orders, Sales forwards the customer request received by phone or email. When available, Sales includes supporting documents and key order details. If information is incomplete, the request is forwarded anyway to trigger the clarification loop, and missing elements are highlighted.

7.2 Step 2 – Inbox triage and assignment

The Order Intake Coordinator reviews new incoming messages, separates true orders from inquiries, registers each order in the Excel Order Book, and assigns ownership to CSLS

processors. Urgent orders (tight requested dates, strategic customers, repeated follow-ups) are flagged for priority treatment. The assigned CSLS owner becomes accountable for follow-up until ERP entry and dispatch coordination.

7.3 Step 3 – Order validation and clarification loop

Before ERP entry, CSLS validates that the minimum required information is available and coherent. When elements are missing or ambiguous (ship-to, requested date, SKU reference, UoM, customer PO, compliance documentation), CSLS requests clarification via Sales and records the issue in the Excel Order Book. The order remains pending until resolution.

7.4 Step 4 – ERP order entry and warehouse request

Once the order is complete, CSLS enters the order in ERP. ERP entry triggers execution: ERP generates the internal warehouse request (picking instruction) and the associated preparation documents needed by the warehouse (e.g., picking list including SKUs, quantities, and handling characteristics).

7.5 Step 5 – Warehouse picking, packing, and preparation confirmation

Warehouse/DC operations pick and pack according to the ERP request. Upon completion, the warehouse provides preparation output documentation (e.g., packing list / preparation confirmation showing what was actually picked and packed). These documents are sent back to CSLS for verification against the ERP request and customer order.

7.6 Step 6 – Logistics control and carrier dispatch

CSLS verifies warehouse documents, confirms that quantities and references match, and validates any required paperwork. CSLS then coordinates pickup with the carrier, ensuring the correct transport mode and documentation are provided. After dispatch, CSLS communicates shipment status to Sales and/or the customer, including tracking references when available.

7.7 Step 7 – Post-dispatch follow-up (invoicing and traceability)

After dispatch, shipment evidence and documents are archived. Finance invoicing activities are triggered based on the confirmed shipment and supporting documentation,

according to local rules. Any deviations (short-pick, damages, delivery issues) are captured in the Excel Order Book (and, where applicable, in a dedicated incident tracker) and managed through the escalation rules.

8. Records and traceability

The following records support traceability and auditability of the process:

- Shared Outlook mailbox: order receipt date/time, customer communication thread, attachments.
- ERP records: order entry timestamp, warehouse request, shipment references where available.
- Warehouse documents: packing list / preparation confirmation and any compliance documents.
- Excel Order Book: intake consolidation and qualitative issue tracking and resolution history (case by case).

9. Exceptions and escalation rules

Exceptions are managed through a structured escalation path to maintain service continuity and ensure fast resolution. Typical exceptions include missing order data, master data blocks for new products, compliance holds, allocation shortages, and warehouse discrepancies.

Escalation path: CSLS owner → CSLS Team Lead → (as applicable) Sales, Planning/Supply, Warehouse management, IT/Master Data, Finance.
